

Submission Worksheet

Submission Data

Course: IT202-008-S2026

Assignment: Milestone 2 API Testing

Student: Angel V. (av847)

Status: Submitted | **Worksheet Progress:** 100%

Potential Grade: 10.00/10.00 (100.00%)

Received Grade: 0.00/10.00 (0.00%)

Started: 4/20/2026 2:19:47 AM

Updated: 4/20/2026 4:24:13 AM

Grading Link: <https://learn.ethereallab.app/assignment/v3/IT202-008-S2026/milestone-2-api-testing/grading/av847>

Instructions

- Overview Link: <https://youtu.be/86v8Ak0E3XE>
- 1. Ensure you read all instructions and objectives before starting.
- 2. Ensure you added your API choice to the Google doc shared on Canvas (selections must be unique, no two students can use the same exact API)
- 3. Create a new branch from Milestone2 called M7-Homework
 - 1. `git checkout Milestone2` (ensure proper starting branch)
 - 2. If you don't have Milestone2 yet, create it from Milestone1
 - 3. `git pull origin Milestone2` (ensure history is up to date)
 - 4. `git checkout -b M7-Homework` (create and switch to branch)
- 4. Follow the lesson from
 - Add `testApi.php` to your project folder
 - Immediately record to history
 - `git add public_html`
 - `git commit -m "adding M7 HW baseline files"`
 - `git push origin M7-Homework`
 - Create a Pull Request from M7-Homework to Milestone2 and keep it open
- 5. Fill out the below worksheet
 - Ensure you add the UCID/Date and details comments as you work
 - Get the example working with your chosen API
- 6. Once finished, click "Submit and Export"
- 7. Locally add the generated PDF to a folder of your choosing inside your repository folder and move it to Github
 - 1. `git add .`
 - 2. `git commit -m "adding PDF"`
 - 3. `git push origin M7-Homework`
 - 4. On Github merge the pull request from M7-Homework to Milestone2
 - 5. On Github create and merge the pull request from Milestone2 to qa
 - 6. On Github create a pull request from qa to prod and immediately merge. (This will trigger the prod deploy to make the Render.com prod links work)

8. Upload the same PDF to Canvas
9. Sync Local
 1. `git checkout qa`
 2. `git pull origin qa`
 3. `git checkout Milestone2`
 4. `git pull origin Milestone2`

Section #1: (2 pts.) Analyze Api Choice

Progress: 100%

⇒ Task #1 (0.40 pts.) - API Link

Progress: 100%

URL #1

<https://rapidapi.com/elis-lab-2-elis-lab-2-default/api/ufc-api5>

URL

<https://rapidapi.com/elis-lab-2-elis-lab-2-default/api/ufc-api5>

Saved: 4/20/2026 2:19:47 AM

⇒ Task #2 (0.80 pts.) - Quota and Limitations

Progress: 100%

Details:

- Note: Hard limits stop when reached, soft limits incur costs when reached (and need a valid credit card associated)
- It's recommend to use a free API with hard limits over one with soft limits, but be mindful of the quota value as it's easy to waste it (through the site's dashboard and/or your own code)

Your Response:

Requests: 100/day ; Hard limit

Rate Limit: 1000 requests per hour

Saved: 4/20/2026 2:39:03 AM

⇒ Task #3 (0.80 pts.) - Goal Data

Progress: 100%

Details:

- Clearly note what type of data you'll be using
- Clearly note the specific properties you intend to use (it's likely not all of them)

Your Response:

My goal data while using this UFC API is I will be displaying a given fighter's fight history (previous 3 fights). The specific properties I intend to use are the given fighters previous fight result, the opponent he/she faced, event the fight took place, date of the event, method of how the fight ended, round in which the fight ended, and the time in that round.

Saved: 4/20/2026 4:24:13 AM

Section #2: (6 pts.) Verify Api Choice

Progress: 100%

≡ Task #1 (6 pts.) - Edit the `testApi.php` file (and related `.env` content) to test your chosen API

Progress: 100%

Details:

- The code will need to be adjusted since your API differs from the one I chose
- You'll need to apply the API `.env` items to Render.com's Environment variables both on `qa` and `prod`
- Be mindful of your API quota (may need to initially use a cached response until you get it working, refer to the lessons for this)

Part 1:

Progress: 100%

Details:

Two screenshots are expected

1. Snippet of relevant code showing solution (with ucid/date comment) 2. Don't show any private details like the API key
2. Full output of executing the `testApi.php` (visit the proper file on Render.com qa after a manual deploy)

```
#!/usr/bin/perl
use strict;
use warnings;
use LWP::Simple;
use JSON;
use Data::Dumper;

my $url = "https://api.ufc.com/fighters/1234567890";
my $response = get($url);
my $data = decode_json($response);

# Print out the fighter's name and opponent's name
print "Fighter: " . $data->{name} . "\n";
print "Opponent: " . $data->{opponent} . "\n";

# Print out the fight result, event, date, method, round, and time
print "Result: " . $data->{result} . "\n";
print "Event: " . $data->{event} . "\n";
print "Date: " . $data->{date} . "\n";
print "Method: " . $data->{method} . "\n";
print "Round: " . $data->{round} . "\n";
print "Time: " . $data->{time} . "\n";
```

≡, Part 3:

Details:
Briefly explain how your solution works. Describe the logic, steps, or decisions your code makes to reach the result. Do not restate the problem or list requirements.

First, the data variable is populated with two parameters. The first being the one parameter required for the API and it's being dynamically filled using \$GET and the second being the datatype which is json. Once that's filled, I created a \$slug variable because the path parameter for the API specifically requires the input to be in "slug" or a "URL-friendly fighter identifier" in order

for the API specifically requires the input to be in slug or a URL friendly fighter identifier in order to get the information. After that, I dynamically insert that slug variable into the URL. Doing it this way allows me to search a fighter and getting the right data for him or her because otherwise I needed to hardcode the fighter's name into the URL. Then, I added the host URL and all of that information was added to the result array. The result array is then used to essentially fetch the data.

Task #2 (0.67 pts.) - WakaTime - Activity

Progress: 100%

Details:

- Visit the WakaTime.com Dashboard
- Click **Projects** and find your repository
- Capture the overall time at the top that includes the repository name
- Capture the individual time at the bottom that includes the file time
- Note: The duration isn't relevant for the grade and the visual graphs aren't necessary

Task #3 (0.67 pts.) - Reflection

Progress: 100%

Task #1 (0.33 pts.) - What did you learn?

Progress: 100%

Details:

Briefly answer the question (at least a few decent sentences)

Your Response:

What I learned from this assignment was what an API is and how it's used. This is something I don't have a lot of experience with so I enjoyed learning and doing some research on it. I look forward to learning more about them in the upcoming lessons for Milestone 2.

Saved: 4/20/2026 4:16:29 AM

⇒ Task #2 (0.33 pts.) - What was the easiest part of the assignment?

Progress: 100%

Details:

Briefly answer the question (at least a few decent sentences)

Your Response:

The easiest part of this assignment was choosing the topic for the API. I am a big sports fan so I knew I wanted to do something regarding that subject. Although it took me a little bit of time to narrow down the exact API I wanted to use, I was able to choose one that I could use that fit the criteria stated for the assignment.

Saved: 4/20/2026 4:19:10 AM

⇒ Task #3 (0.33 pts.) - What was the hardest part of the assignment?

Progress: 100%

Details:

Briefly answer the question (at least a few decent sentences)

Your Response:

The hardest part of the assignment was probably getting the code to properly display the right information from the API. At first I had an issue with the key and then the URL. I also had an issue with the parameters as my specific API had a required parameter instead of an optional one so I had to figure out how to get around it. Despite some trouble, I was able to figure it out and get the code to fetch and display the right data in the end.
